AI – Generated Image and Analysis

There are many AI image generators on the internet. Out of them I have chosen some of the popular image generators using AI.

They are:

1. Stable Diffusion
2. Mid Journey
3. Deep Dream Generator

The prompt which is chosen to give is

Prompt: A super car drifting on a race track with smoke coming out from its wheels.

All three of them produced images different from each other. Each of them were different in its own aspect.
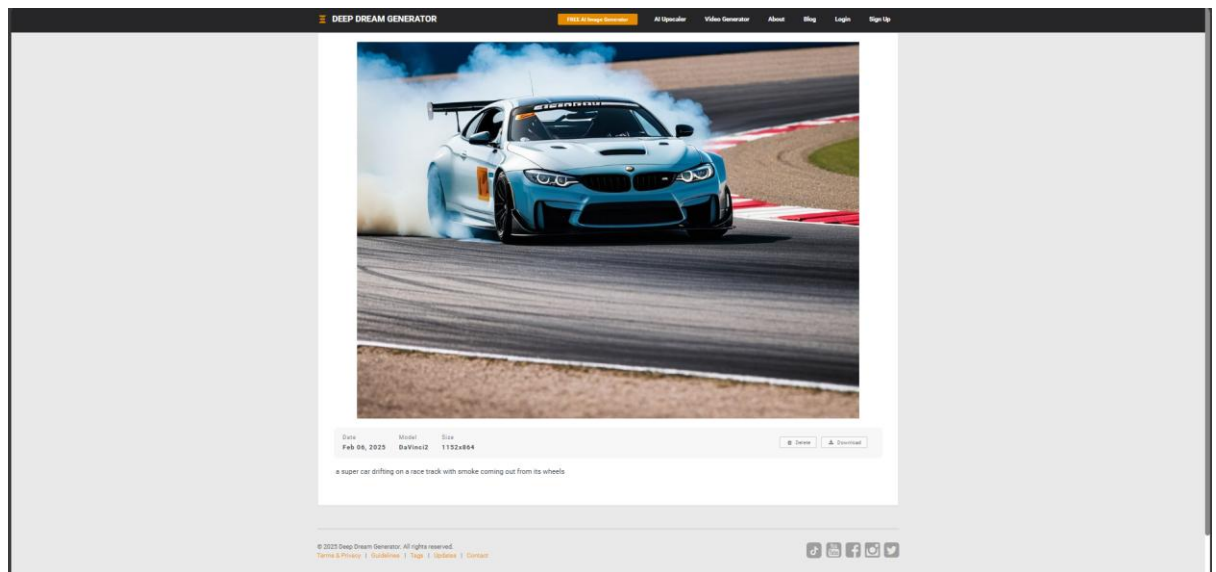

The images generated were as follows:

1. STABLE DIFFUSION

2. MID JOURNEY

3. DEEP DREAM GENERATOR

The images generated by the three AI's were up to the mark of my prompt. But in terms of the diversity of the images produced Mid Journey has provided with multiple images of different cars whereas deep dream generator only produced one image per prompt.

Both Mid Journey and Stable diffusion give us various other options for the styles, camera angle, lighting, aspect ratio. But Mid Journey takes a notch over other both since it also has various models to generate images based on our requirement.

Since each of the image generators use the concept of tokens to generate the images. In my opinion I felt that mid journey better due to variety of images produced for the prompt and features it provides.

Overall all the images generators are good in their aspects but I felt Mid Journey better to use due to its interface and options that I can use to generate the type of image I require.
